1. Validation report *Epidalea calamita* detection kit

1.1 In silico validation

Table 3: Forward primer *in silico* validation

Length	20
GC %	60
Stability	2.2
T _M (°C)	62
Target region	COI (mtDNA)
Dimer	No
Run	No
Database hit	<i>Epidalea calamita</i>

Table 4: Reverse primer *in silico* validation

Length (bp)	18
GC %	72
Stability	2.5
T _M (°C)	66
Target region	COI (mtDNA)
Dimer	No
Run	No
Database hit	<i>Epidalea calamita</i>

Table 5: Probe *in silico* validation

Length	32
GC %	52
T _M (°C)	70
Target region	COI (mtDNA)
Dimer	No
Run	No
Fluorescence label	FAM

Table 6: Combined primers and probe *in silico* validation

PCR product size (bp)	89
Combined dimer formation	No
<i>In silico</i> PCR on Genbank	<i>Epidalea calamita</i>
Date of <i>In silico</i> PCR	March 2022

1.2 Experimental validation

All validation experiments were performed with the Sylphium qPCR mix and performed on Applied biosystems 7300 qPCR machines and Biometra gradient PCR machines.

1.2.1 Gradient PCR

Influence of the annealing temperature on the performance and specificity of the primer set was tested with a temperature gradient between 50°C to 70°C in eight steps. Optimal temperature and the temperature range in which the test can perform was determined.

Results:

The expected product was formed at all tested temperatures (50°C to 70°C). The optimal annealing temperature was between 50 °C and 63,6°C. (table 8).

Annealing temp.	50.0°C	51.9°C	56.4°C	58.8°C	61.2°C	63.6°C	68.1°C	70.0°C
Expected fragment	Strong	Strong	Strong	Strong	Strong	Strong	Weak	Weak
Primer dimer	No	No	No	No	No	No	No	No
Additional fragments	No	No	No	No	No	No	No	No

Table. 8: Temperature gradient PCR on genomic DNA.

1.2.2 Detection limits and fluorescence output signal

Standard solutions with 10^5 , 10^4 , 10^3 , 10^2 , 10 and 0 target copies per 2 µl were analyzed to determine the detection limit at optimal primer/probe concentrations. Fluorescent output signals were compared with the background to have at least a 100 fold increase in fluorescence signal. Reaction condition were adjusted if the fluorescence signal was too low in contrast to the background noise.

Results:

Limit of detection (LDqPCR) for this kit was determined on 1 copies per reaction. Limit of quantification (LQqPCR) was determined on 10 copies per reaction. The fluorescence output signal was at least 100 (7 for positive sample, 0,01 for a negative sample) times stronger than the background signal. (fig. 4, table 9)

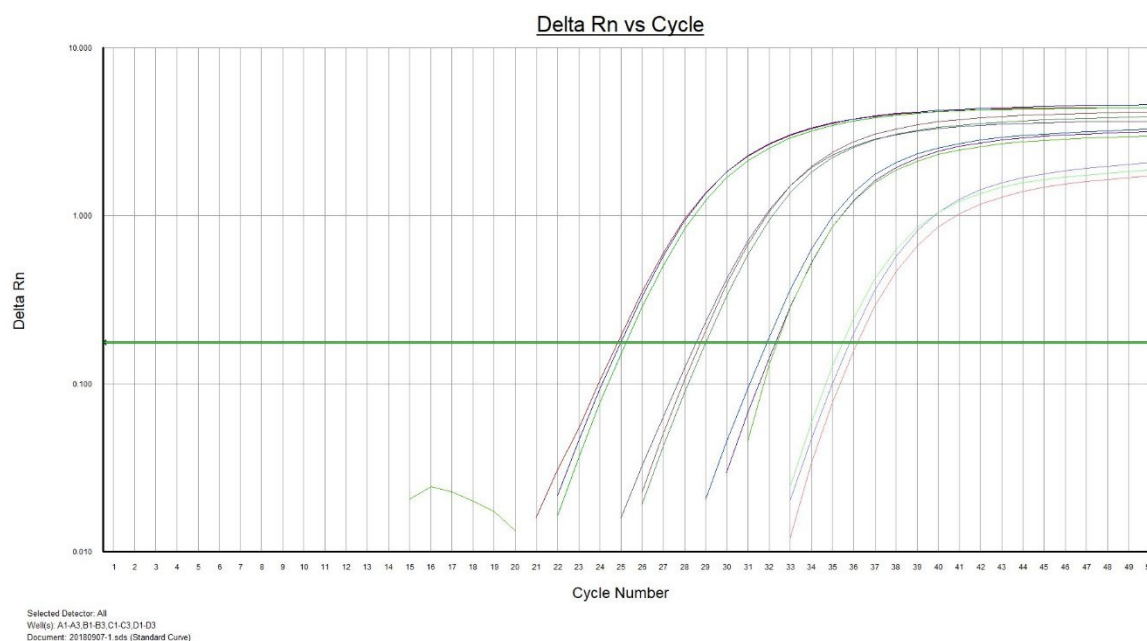

Figure. 4: Obtained fluorescent signal at optimal primer/probe concentration at a annealing temperature of 55°C.

Table 9: CT values obtained at optimal primer/probe concentration.

target DNA ¹ copy	Target detected	CT value	Standard deviation
0	No	-	-
10	Yes	Nd ²	Nd ²
10 ²	Yes	35,8	0,3
10 ³	Yes	32.1	0,2
10 ⁴	Yes	28.7	0,2
10 ⁵	Yes	25.0	0,2

¹ Estimated by gel electrophoresis

² Not determined as very low amounts of DNA cannot reliable quantitatively detected by the qPCR technique

1.2.3 Efficiency

Based on the slope of the standard curve the efficiency of the primer/probe set was determined.

Results:

The efficiency of the test was above 90%. Which means that the efficiency of the primer/probe mixture can be regarded optimal (Fig. 5, table 10).

Fig. 5: Standard curve of SYL106 based on 10^2 , 10^3 , 10^4 and 10^5 DNA target copies

Table 10: Values obtained from the standard curve

Slope	-3.56
Efficiency	90,9%
R ²	0.996

1.2.4 Influence of inhibiting factors present in environmental samples and repeatability

Performance of the test was tested on the influence of inhibiting factors present in three different kinds of environmental water samples (sandy, clayey or peaty bottoms) in three fold spiked with 1000 target DNA copies. Standard deviations, one way ANOVA and the standard error of mean were calculated to determine robustness, repeatability and measurement uncertainty.

Results:

No fluorescent output signal was detected in the environmental samples without added target organism DNA (spike). Spiked samples and the spike only analyses gave in all replicates a positive signal. (see table 9). There were no statistically significant differences between group means as determined by one-way ANOVA ($F(3,8) = 3,712$, $p = .06$). Influence of chemical and biological factors present in environmental samples was not detected. The standard error of mean was 0.14 within these samples.

Table 11: CT values obtained with target organisms free environmental samples spiked with 1000 target copies.

Sample	CT value	Standard deviation
Sandy	-	-
Clayey	-	-
Peaty	-	-
Sandy + spike	30.6	0.2
Clayey + spike	30.9	0.3
Peaty + spike	30.8	0.2
Spike only	30.1	0.1

1.2.6 Sequence conformation of specificity.

PCR products obtained from the gradient PCR experiment were sequenced for conformation of identity of the formed product. If any product was formed with target organism free environmental samples, than these products were also be sequenced.

Results:

Target organism free environmental samples did not give any PCR product. PCR products obtained from the gradient PCR experiment were sequenced in triplo via the Sanger sequencing method. The obtained sequences were identical to each other and Blast[®] hits confirmed identity of the target organism.

1.3 Summary of validation

1.3.1 Robustness

“Influence of temperature variations and inhibiting factors present in environmental samples on the performance and specificity of the primer set”

- Primers specific at temperature range: 50°C – 63.6°C (section 1.2.1, section 1.2.2, table 8, table 9)
- Statistical differences ($p > 0.05$) due to influence of chemical and biological factors present in environmental samples on the performance of the test were not found. (section 1.2.4, table 11)
- Fluorescent output signals of positive samples is at least 100 fold stronger than the background

1.3.2 Detection limit

“Lowest limits in which the analysis can be reliably applied”

Limit of detection (LDqPCR) for this kit was determined on 10 copies per reaction. Limit of quantification (LQqPCR) was also determined on 10 copies per reaction. (section 1.2.2, table 8)

1.3.4 Efficiency

“The comparison of what is actually produced with what can be achieved with the same consumption of resources”

The efficiency of the primer set is 90.6 %, this means that the primer/probe mixture can be regarded as optimal. (section 1.2.3, table 9)

1.3.5 Repeatability

“The degree of similarity between the results of measurements of the same measured quantity that were performed under different measurement conditions”

There was no statistical differences ($p > 0.05$) between different kinds of environmental water samples (sandy, clayey or peaty bottoms) spiked with 1000 target DNA copies. (section 1.2.4, table 11)

1.3.6 Correctness

“The ability of the method to do what it 'says' to do”

- The test was able to detect *Epidalea calamita* DNA in environmental samples from locations where the presence of *Epidalea calamita* was suspected. (section 1.2.6)
- The method did not give any other combined BLAST hit than the target organism *Epidalea calamita*
- The method was able to detect all spiked target DNA in target organism free environmental samples (section 1.2.4, table 10)
- The method did not give any signal in target organism free environmental samples (section 1.2.4, table 11)
- The standard error of the mean based on the measured CT values from the spiked experiments (1000 target copies) was 0.4 on an average of 30.6.
