# 1. Validation report pathogenic *Leptospira* detection kit

## 1.1 In silico validation

**Table 1: Forward primer *in silico* validation**

Length	23
GC %	34
Stability	2.0
T <sub>M</sub> (°C)	60
Target region	16sRNA
Dimer	No
Run	No
Database hit	pathogenic <i>Leptospira</i>

**Table 2: Reverse primer *in silico* validation**

Length (bp)	36
GC %	25
Stability	2.3
T <sub>M</sub> (°C)	62
Target region	16sRNA
Dimer	No
Run	No
Database hit	pathogenic <i>Leptospira</i>

**Table 3: Probe *in silico* validation**

Length	27
GC %	55
T <sub>M</sub> (°C)	74
Target region	16sRNA
Dimer	No
Run	No
Fluorescence label	FAM

**Table 4: Combined primers and probe *in silico* validation**

PCR product size (bp)	118
Combined dimer formation	No
<i>In silico</i> PCR on Genbank	pathogenic <i>Leptospira</i>
Date of <i>In silico</i> PCR	January 2019

## 1.2 Experimental validation

All validation experiments were performed with the Sylphium qPCR mix and performed on Applied biosystems 7300 qPCR machines and Biometra gradient PCR machines.

### 1.2.1 Gradient PCR

Influence of the annealing temperature on the performance and specificity of the primer set was tested with a temperature gradient between 52.0°C to 72.0°C in ten steps. Optimal temperature and the temperature range in which the test can perform was determined.

#### Results:

The expected product was formed between 52.0°C and 65.5°C. Nonspecific additional fragments were formed at 52.0°C and 53.8°C. No primer dimer were formed at any tested temperature. The optimal annealing temperature was between 56.0°C and 63.2°C (table 8).

**Table. 8: Temperature gradient PCR on genomic DNA of pathogenic *Leptospira*.**

Annealing temp.	52.0°C	52.4°C	53.8°C	56.0°C	58.4°C	60.8°C	63.2°C	65.5°C	67.9	72.0
<b>Expected fragment</b>	Strong	Strong	Strong	Strong	Strong	Strong	Strong	Weak	No	No
<b>Primer dimer</b>	No	No	No	No	No	No	No	No	No	No
<b>Additional fragments</b>	Weak	weak	weak	No	No	No	No	NO	No	No

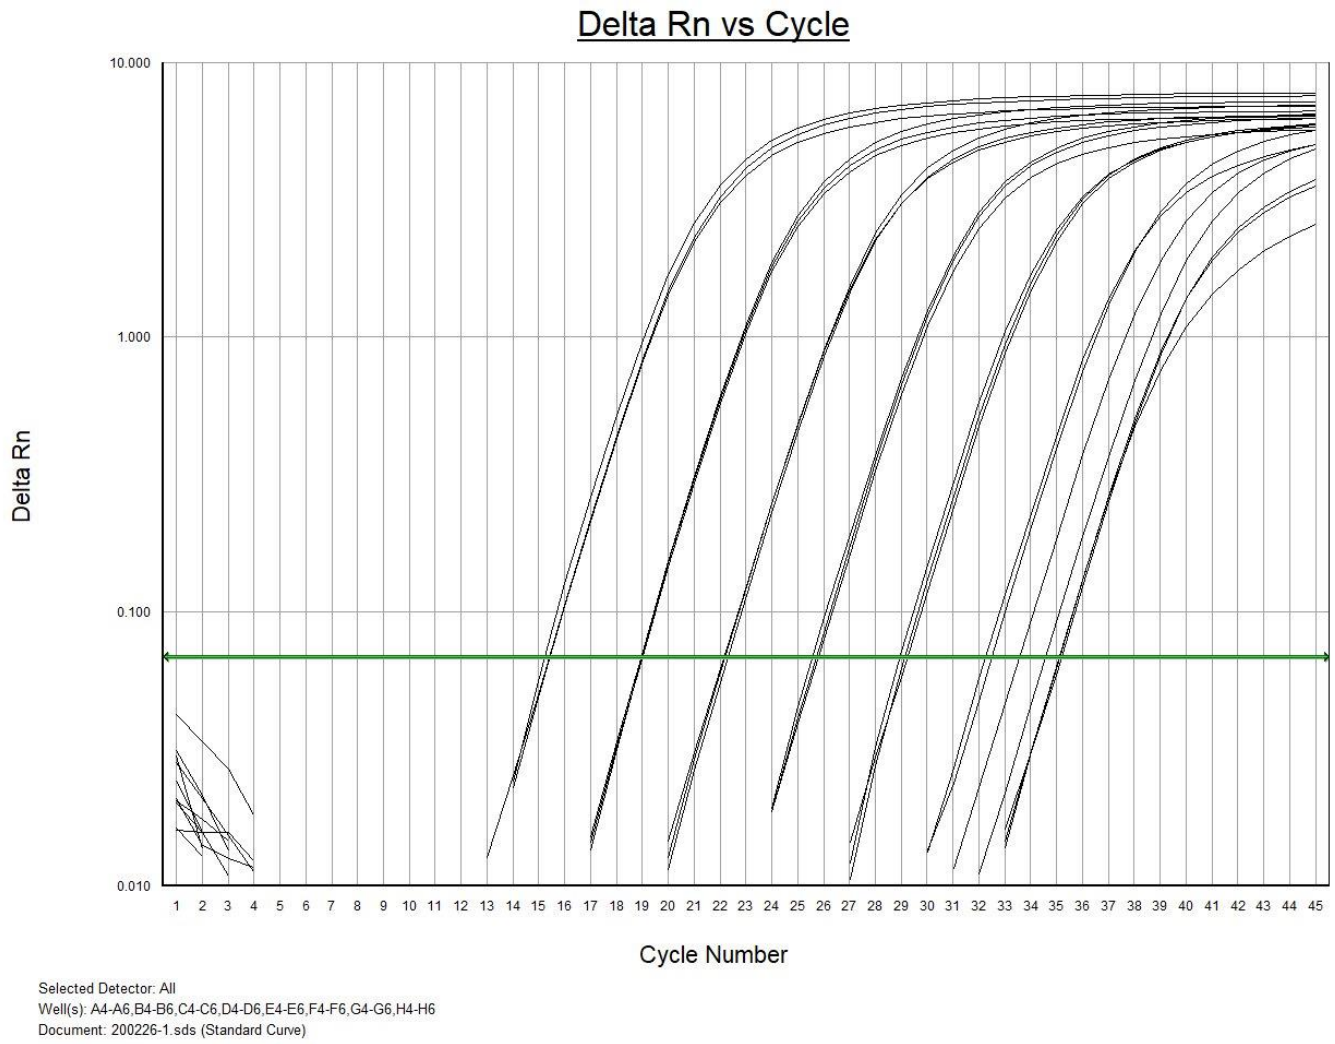

### 1.2.2 detection limit, fluorescence output signal and efficiency

Standard solutions with  $10^7$ ,  $10^6$ ,  $10^5$ ,  $10^4$ ,  $10^3$ ,  $10^2$ , 10, 1 and 0 target copies per 2 µl were analyzed to determine the detection limit at optimal primer/probe concentrations. Fluorescent output signals were compared with the background to have at least a 100 fold increase in fluorescence signal. Reaction condition were adjusted if the fluorescence signal was too low in contrast to the background noise. Based on the slope of the standard curve the efficiency of the primer/probe set was determined. The efficiency should be between 90% and 110%. Limits of quantification and detection were determined on basis of this efficiency limitations.

#### Results:

Limit of detection (LDqPCR) for this kit was determined at 1 copy per reaction. Limit of quantification (LQqPCR) was determined at 10 copies per reaction. (Fig. 5, table 9).

The fluorescence output signal was at least 100 (9 for positive sample, 0,01 for a negative sample) times stronger than the background signal. (fig. 4, table 8)

**Figure. 4: Obtained fluorescent signal at optimal primer/probe concentration at a annealing temperature of 60°C.**

target DNA <sup>1</sup> copy	Target detected	CT value	Standard deviation
0	No	-	-
1	2/3	-	-
10	Yes	34.9	0.4
10 <sup>2</sup>	Yes	32.7	0.7
10 <sup>3</sup>	Yes	29.1	0.1
10 <sup>4</sup>	Yes	25.6	0.1
10 <sup>5</sup>	Yes	22.2	0.1
10 <sup>6</sup>	Yes	19.0	0.0
10 <sup>7</sup>	Yes	15.3	0.1

**Table 8: CT values obtained at optimal primer/probe concentration. <sup>1</sup> Estimated by gel electrophoresis**

**Fig. 5: Standard curve of SYL131 based on  $10^7$ ,  $10^6$ ,  $10^5$ ,  $10^4$ ,  $10^3$ ,  $10^2$  and 10 DNA target copies**

**Table 9: Values obtained from the standard curve**

Slope	-3.35
Efficiency	98.8%
R <sup>2</sup>	0.996

### 1.2.3 Influence of inhibiting factors present in environmental samples and repeatability

Performance of the test was tested on the influence of inhibiting factors present in three different kinds of environmental water samples (sandy, clayey or peaty bottoms) in three fold spiked with 1000 target DNA copies. Standard deviations, difference to spike and the standard error of mean were calculated to determine robustness, repeatability and measurement uncertainty.

#### Results:

No fluorescent output signal was detected in the environmental samples without added target organism DNA (spike). Spiked samples and the spike only analyses gave in all replicates a positive signal. (see table 11). The difference between environmental samples and the spike only sample was less than 3%. Influence of chemical and biological factors present in environmental samples was not detected. The standard error of mean was 0.07 within these samples with an average of 30,5. There was no statistical differences between samples (ANOVA,  $p = 0.75$ ).

Sample	CT value	Standard deviation	Difference to spike
Sandy	-	-	-
Clayey	-	-	-
Peaty	-	-	-
Sandy + spike	30.3	0.2	0.6 %
Clayey + spike	30.6	0.3	0.1 %
Peaty + spike	30.5	0.3	0.1 %
Spike only	30.5	0.3	-

**Table 11: CT values obtained with target organisms free environmental samples spiked with 1000 target copies.**

#### 4.2.4 Detection conformation in environmental samples

Conformation of detection with the test was performed on samples from locations where the presence of Pathogenic *Leptospira* was suspected. Samples were taken using SYL001 - Environmental sampling kit and eDNA was isolated using SYL002 -Environmental DNA isolation kit.

#### Results:

Not yet executed

#### 1.2.5 Sequence conformation of specificity.

PCR products obtained from environmental samples were sequenced for conformation of identity of the formed product. If any product was formed with target organism free environmental samples, than these products were also be sequenced.

#### Results:

Not yet executed

## 1.3 Summary of validation

### 1.3.1 Robustness

*“Influence of temperature variations and inhibiting factors present in environmental samples on the performance and specificity of the primer set”*

- Primers specific at temperature range: 56.0°C - 63.2°C (section 1.2.1)
- Influence of chemical and biological factors present in environmental samples on the performance of the test were not found. (section 1.2.3)
- Fluorescent output signals of positive samples is at least 100 fold stronger than the background

### 1.3.2 Detection limit

*“Limits (lower and upper limit) within which the analysis can be reliably applied”*

- Limit of detection (LOD) for this kit was determined on 1 copy per reaction. Limit of quantification (LOQ) was also determined on 10 copies per reaction. (section 1.2.2)

### 1.3.4 Efficiency

*“The comparison of what is actually produced with what can be achieved with the same consumption of resources”*

The efficiency of the primer set is 98.8 %, this means that the primer/probe mixture can be regarded as optimal. (section 1.2.2)

### 1.3.5 Repeatability

*“The degree of similarity between the results of measurements of the same measured quantity that were performed under different measurement conditions”*

There was no difference ( $\Delta CT < 2$ ) between different kinds of environmental water samples (sandy, clayey or peaty bottoms) spiked with 1000 target DNA copies. (section 1.2.3)

### 1.3.6 Correctness

*“The ability of the method to do what it 'says' to do”*

- The method did not give any other combined BLAST hit than the target organism pathogenic *Leptospira*
- The method was able to detect all spiked target DNA in target organism free environmental samples (section 1.2.3, table 8)
- The method did not give any signal in target organism free environmental samples (section 1.2.3, table 8)
- The standard error of the mean based on the measured CT values from the spiked experiments (1000 target copies) was 0.07 on an average of 30.5
